

CYBER SECURITY TASK 02

PART C – RISK ASSESSMENT ACTIVITY

NAME : BHAKTI MAHADEV PARHAD

Risk Assessment for a College :

As a Security Analyst, it is important to identify the critical assets within a college and assess the risks they face. A risk assessment helps prioritize security measures by evaluating potential threats, their impact, and the overall level of risk.

Asset	Threat	Impact	Risk Level
Student Records	Data Breach / Unauthorized Access	Exposure of personal and academic information, identity theft, and privacy violations.	High
Examination Database	Unauthorized Modification	Incorrect grades, loss of academic integrity, and student complaints.	High
College Website	DDoS Attack / Website Defacement	Website becomes unavailable, disrupting admissions and communication.	Medium
Faculty Information	Insider Threat / Data Theft	Exposure of confidential employee information and loss of trust.	High

Network Infrastructure	Malware / Ransomware Attack	Network downtime, disruption of online classes, and possible data loss.	High
Learning Management System (LMS)	Account Compromise	Students and faculty may lose access to course materials and assignments.	Medium
Financial Records	Phishing / Financial Fraud	Financial losses, unauthorized transactions, and legal issues.	High

Summary :

The assessment shows that student records, examination data, financial records, and network infrastructure have the highest risk because they contain sensitive information or are essential for daily college operations. Implementing strong security controls such as Multi-Factor Authentication (MFA), regular backups, access control, employee awareness training, and continuous monitoring can significantly reduce these risks.
